

We conducted discussions with different stakeholders to understand the existing problems, user needs, and expected features of the system. The collected information is summarized below.

1. Teacher's Requirement:

Stakeholder: Saad Sir

Feedback: "Verify the problem and face the requirements."

Identified Requirement:

The system should first identify and verify the actual problems faced by users in the existing blood donation process. The requirements should be based on real-life problems and user needs rather than assumptions. This following photograph provide evidence of our requirement collection process. With Saad Sir.

2. Medical Center's Requirement

Stakeholder: Medical Center Representative(Mosaffor Hossain)

Feedback:"It is difficult to find rare blood groups."

Identified Requirement:

Finding donors for rare blood groups is difficult, especially during emergency situations.

This following photograph provide evidence of our requirement collection process.

3.Staff's Requirement

Stakeholder: Staff Member

Feedback:"There can be a common group where we can get all types of help."

Identified Requirement:

There should be a common platform or group where people can get different types of blood donation-related help and communicate with others.

This following photograph provide evidence of our requirement collection process.

4.Student's Requirement

Stakeholder: Talha,Fahim

Feedback:"Blood should be ready beforehand in case any disaster occurs."

Identified Requirement:

The system should support advance preparation of blood resources so that blood can be arranged quickly during disasters or other emergency situations.

This following photograph provide evidence of our requirement collection process.

5.Blood Donation Group Administrator's Requirement

Stakeholder: Medical Center Blood Donation Group Administrator(Rayhan vai)

Requirement:

The administrator should be able to manage blood donation activities and coordinate between blood donors and people who need blood.

This following photograph provide evidence of our requirement collection process.

Proposed Solution

Based on the collected requirements, we propose a Blood Donation Management System that will provide a centralized platform for finding and managing blood donors.

The system will:

- Help users find donors by blood group, especially rare blood groups.
- Provide an emergency blood request option.
- Include the Medical Assistant's contact number for quick communication.
- Create a common platform/group for blood-related assistance.
- Maintain a list of available donors for emergencies and disasters.
- Allow administrators to verify and manage blood requests and donor information.

This system will make blood searching faster, easier, and more organized.
